

Polymer particles containing active agents

Abstract

- 5 The invention relates to active ingredient-containing polymer particles comprising a vinyl polymer from 10-80% by weight monomers comprising amino and/or carboxyl groups, which is insoluble in one part of the pH range 0-10 and is soluble in another part of the range, wherein these active ingredient-containing polymer particles comprise
- 10
- 3-1000 parts of active ingredient per part of vinyl polymer,
 - have a particle size in the range 20 nm-8 μ m and
 - the vinyl polymer is > 50% by weight composed of polymers having a molecular weight of < 100 000 daltons.
